- Do analysis of customers. Get a complete record of activity of all fleet vehicles at the customer site
- Reports
 - Vehicle Activity Report
 - Location Report
 - Status Report
 - Unit Stops Report
 - Customer Activity Report

Automatically get a complete record and analysis of what stops are made by your rolling assets. TRAKIT NATIONWIDE STOP ANALYSIS is a system module incorporated in the TRAKIT NATIONWIDE WEB-CLIENT software that automatically captures information on vehicle activity to recognize the location, time and duration of stops. The stops are geo-referenced in the system to associate the event of the vehicle stop with a database that can contain various elements of information including account number, name, address, phone, etc. The vehicle activity captured by TRAKIT NATIONWIDE is processed to generate various fleet management reports including the Activity Report, Customer Activity Report and Unit Stops Report. Generic location activity and stop activity ASCII files can be downloaded for use by common spreadsheet and database utility programs. The system was designed for simple and intuitive operation and allows for virtually automatic geo-referencing of stops. A reconciliation step is included in the processing to allow the operator to make intelligent decisions on identifying and matching the correct data in the system with the vehicle stop. This process step assures the accuracy and completeness of fleet management reports.
